Example:

A recipe calls for 250 mL of milk. How many liters of milk is that?

Solution:

Since $1 \text{ L} = 1000 \text{ mL}$,

$$250 \text{ mL} = 250 / 1000 = 0.25 \text{ L}$$

- Distance, Speed, and Time Problems

These problems often involve calculating one of the variables when given the other two, using the formula:

$$\text{Distance} = \text{Speed} \times \text{Time}$$

Example:

A car travels at 60 km/h for 2 hours. What is the total distance traveled?

Solution:

$$\text{Distance} = 60 \text{ km/h} \times 2 \text{ h} = 120 \text{ km}$$

- Volume and Capacity Problems

These involve measuring and converting liquids or solids' quantities.

Example:

A swimming pool contains 15,000 liters of water. How many cubic meters is that?

Solution:

Since $1 \text{ m}^3 = 1000 \text{ L}$,

$$15,000 \text{ L} = 15,000 / 1000 = 15 \text{ m}^3$$

- Mass and Weight Problems

These focus on converting weights and understanding mass relationships.

Example:

An object weighs 2.5 kilograms. What is its weight in grams?

Solution:

Since $1 \text{ kg} = 1000 \text{ g}$,
